Annotations

- Version pill (right-aligned)** Dimmed build pill sits on the RIGHT, beside the account menu. Hover reveals the build sha; on phones it folds into the account menu.
- Account menu** Avatar + name + chevron open the account menu (profile, settings, sign out). On narrow screens the feedback / bug / dark-mode icons and version pill collapse into here.
- Fixed vs deploy-time** Semantic search over any registered source. The **embedding model + dimension** are one fixed install setting (backend .env); **sources** — which tables, how they're rendered & chunked — are deploy-time config. Read-only here. Lets people search by meaning, not just exact words — the app stores text as 'embeddings' it can match.
- One column, one index** One vector(1024) column + one HNSW index. Changing the model in .env enqueues a full re-embed — no migration.
- Polymorphic sources** Sources are polymorphic: one embedding row per **chunk** holds one vector(1024) + its filter values, keyed by the virtual (source_schema, source_table, source_id) — so a source can live in another schema or a remote system.
- Long text is split into smaller pieces so each piece can be searched on its own.
- Extra columns saved with each piece, so a search can be narrowed (e.g. to one run).

-
- 8 **Auto re-embed** Local source — an insert/update/delete auto-enqueues re-embedding via a trigger. To change what's embedded, edit the deploy-time config, not this screen.
-
- 9 The text built from each row, before it's split up and saved for search.
