What is being imported

Experiments

▼

3

Each row is validated before anything is written. Rows with errors are listed and skipped; the rest are inserted together and recorded in the audit trail.

18 rows · 2 warnings

| Row | Name                      | Status |
|-----|---------------------------|--------|
| 1   | Terse-prompt replication  | OK     |
| 2   | Politeness · SLM ensemble | OK     |
| 3   | (missing name)            | SKIP   |
| 4   | Self-consistency probe    | OK     |

Import 16 rows

 **Annotations**

1

**Bulk import** The shared Import affordance, offered on every list screen. It accepts a CSV, XLSX, or JSON file, validates each row, then bulk-inserts — the same parse → validate → insert → audit path the real app uses.

2

Drop a file here, or choose one from your computer.

3

**Validate before insert** Rows are parsed and validated first; any that fail (duplicate keys, missing required fields, bad enum values) are reported and skipped, and the successful rows are inserted in one transaction and written to the audit trail.

4

Discard changes and close.
